

Aid since 1980

June 3, 2020

Here are some thoughts regarding this mini-project. We would like to observe various data aiddata-countries-only.csv.

```
df <- read.csv("1_Data/aiddata-countries-only.csv")
df2 <- df %>% filter(2020 > year & year >= 1980)

tikz(file = "3_Figures/total_aid_since_1980.tex", width = 3, height = 2)
df2 %>%
  group_by(year) %>%
  filter(commitment_amount_usd_constant > (5 * 10 ^6)) %>%
  summarize(sum = sum(commitment_amount_usd_constant)) %>%
  ungroup() %>%
  ggplot() +
  geom_smooth(se=FALSE, mapping = aes(x = year, y = sum))

## `summarise()` ungrouping output (override with `.groups` argument)
## `geom_smooth()` using method = 'loess' and formula 'y ~ x'
dev.off()

## pdf
## 2
```
